Jatleki J., Niewiarowski A., Dury S. Tentatives of Using Polyphosphates in Meat Processing.

„Próby zastosowania polifosforanów w przetwórstwie mięsnym”
Przemysł Spożywczy, No. 10, 1955, pp. 414-416, 3 tabs.

A sodium polyphosphate suitable for use in meat processing. 0.5 per cent additions of the polyphosphate enhance the quality of steamed meat products. Tested on Vienna and ordinary sausages it improved binding, fixed the colour and had a favourable effect on juiciness. 0.5 per cent additions of polyphosphate to pickles for injections improve the quality of pasteurised ham by binding meat juices better and thus eliminating „weeping” ham. Polyphosphates do not affect the pH of meat products and appear to have no effect on the flavour, colour and amount of jelly in hams; investigations should, however, be continued over this problem. The polyphosphate obtained can be used, in quantities of 1.2 g. per litre, for stabilizing blood.

AUTHOR: Niewiarowski, J.

TITLE: Project of a repeated precision-leveling network for the investigation of the present vertical movements of the terrestrial crust on the territory of Poland

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 5, 1962, 26, abstract 5G164 ("Prace Inst. geod. i kartogr.", 1961, 8, no. 2, 73 - 92, Polish; Russian and English summaries)

TEXT: After a brief description of the geological structure and tectonics of the territory of Poland, the author describes the main features of a project concerning a leveling network for the investigation of the present vertical movements within this territory. Since the leveling lines must be as perpendicular as possible to the lines of strike of the geological structures, the leveling lines in the north-eastern part of Poland are oriented essentially from north-east to south-west, and in the south of Poland, they are oriented along the meridians. Into the repeated-leveling network are included all the existing lines of the first class State leveling and a part of the lines of the second

Card 1/2

Project of a repeated...

S/035/62/000/005/081/098
A055/A101

class, as well as two new leveling lines of the first class that cross two existing western polygons. The connection of the Polish network with the networks of the USSR, the German Democratic Republic and of Czechoslovakia is planned. To obtain the velocities of the movements with an error of ± 1 mm/year, the leveling of the network must be repeated at intervals of 15 - 20 years. The precision of the leveling must be such as to ensure a total RMS error not exceeding ± 0.5 mm/km. There are 13 references.

From the author's summary

"Studies on the Congenital Hemorrhagic Diathesis in Poland."

Krakow, Polis Biologica, Vol 16, No 3-4, 1962; pp 322-325.

Abstract [English article]: Condensed version of paper presented at January 1962 human genetics symposium in Warsaw. Studies begun in 1957 at Institute of Hematology (Prof KOWALSKI, Drs CERNAROWICZ, LUTALLO and SABIUSKI.) Hemophilia A (227 cases = 80.2%) and B (27, 9.5%) are most frequent. There are 19 hemophiliacs living in Warsaw; extrapolating to all of Poland, about 1000 males. There are probably many more in mild and latent cases are included. Typical sex-linked inheritance in A and B. Illustrations show genealogic tree of an afibrinogenemia patient and one with congenital macrocytic thrombocytopenia; both inherited as recessive autosomic traits; in latter, blood platelet morphology is heterozygotes is typical. Four diagrams.

Metody badania barwników i wybarwień na skórze.

Przegląd Skórzany, No. 5, 1951, pp. 189-200.

ROL

Arising out of the standardisation drive now being pursued in respect of test methods, the author deals with methods prevalent in Poland and abroad for testing the properties of dyestuffs and the colour fastness of leathers. He reviews the test methods for fastness to light, friction, water, currying, perspiration and formalin. To avoid the occurrence of stains during the dyeing process the dyestuffs should be carefully dissolved prior to use; with this end in view, the author describes the means for testing the solubility of leather dyestuffs.

4491. "Forbidden Lines in the Neutral Lead Spectrum." H. Niewodniczanski. <i>Acta Physica Polonica</i>, 24, pp. 675-682, 1954. In English. The spectrum was excited in a quartz electrodeless tube using a 60-cm. oscillator. The tube could be heated in a furnace, and measured quantities of He or Ar introduced. Of the four lines measured, 4610.0, 4618.7, 4620.4 and 7800 Å, only the first could be excited in pure Pb vapour, the remainder requiring the presence of inert gas. The first is explained as a pure magnetic dipole radiation, the second and third as pure quadrupole radiation and the last as a mixture of the two. F. S.

"The transverse Zeeman effect of the 'forbidden' Pb I line λ 4018: an experimental proof of the existence of magnetic dipole radiation." Henryk Niewodniczanski, *Acta Phys. Polonica A*, 22:441 (1964) (in English). *Comp. rend. 196, 846-851 (1964)*. The "forbidden" line λ 4018 ($6p^2 \ ^3P_1 - 6s^2 \ 6p^2 \ ^3S_1$), which is known to consist of 2 combined components of a summative intensity of 77.3% of the total intensity, is dissected in a transverse magnetic field into a triplet with one component, σ , not displaced, and 2 components are shifted. An interpretation of the nature of the "forbidden" Pb I line as a magnetic dipole line is added. Cf. C. A. 28, 707.

"Forbidden Spectral Lines." H. Niewodniczanski. *Acta Physica Polonica*, 6, pp. 444-480; Discr. 190-199, 1939. In German.— This is a review of work on the subject which has appeared since the article by Rusznarwick and Blaton [see Abstract 1000 (1933)]. In the first section the rules, according to which these lines should not appear, are explained. The second deals with present knowledge concerning electric quadrupole lines and magnetic dipole lines, while the third is concerned with forbidden lines in the spectra of HgI and CdI. P. B.

1993. Effect of thermionic emission at room temperature in photoconductive Geiger-Müller tubes. GROTEWILSKI, A. Z. HRYNIEWICZ AND H. NIEWODNICZARSKI. Bull. Acad. Polon. Sci. Cl. 5, 2, No. 1, 109-11 (1993).

Reports a study of the increase in background level with temperature which is often observed as an aging effect with G-M counters. New, clean tubes did not show any dependence of background on T. However, when the counters were made photosensitive by running a discharge in argon, these tubes exhibited a strong increase in background count with T. The difference in count between the two runs was assumed to give a measure of the thermionic emission. The data thus obtained were used for a Richardson plot which proved to be a straight line with work function ≈ 1.0 eV. The thermionic origin of the background count is thus confirmed.
